Here, the first line captures messages at all severity levels and writes them to a file called haproxy-traffic.log. The second line captures only notice-level messages and above, logging them to a file called haproxy-admin.log. HAProxy is hardcoded to use certain severity levels when sending certain messages.

I was just wondering if the community has experimented with testing a multi server setup? For example, I'm envisioning 2 plex servers configured to use the same meta-data, and media, with a HAProxy server in the front end that I can use to distribute the load across.

Has anyone tried load balancing plex servers? : PleX
